

## QCAT - Bug #1910

User Story # 1897 (Closed): API endpoints to add new cases

### API Authentication: First successful authentication answers with outdated token

17 Sep 2020 15:00 - Kurt Gerber

<b>Resolution:</b>	fixed		

#### Description

I authenticate through the API successfully with user name and password.

As response I receive a token,

When I use that token, in any other request for editing data through the API, it fails with the response:

```
{  
"detail": "APP Token expired, request a new APP Token"  
}
```

Effectively it responds with the token which I used the last time I was playing with editing through API. I can see that, as my last Token is stored in postman in the different requests I formerly did.

But when I authenticate a second time, I get a new token, which then works.

That has to be solved, as in a mobile app, that would cause major problems.

Hi Kurt, this should be fixed up now.

I had logic to expire and re-issue the token when the Edit API endpoints were being used but not on the Auth endpoint.  
Easy fix!

- Resolution set to fixed

Solved. Works now.
